

## UTILIZATION MANAGEMENT MEDICAL POLICY

**POLICY:** Hematology – Ceprotin Utilization Management Medical Policy

- Ceprotin<sup>®</sup> (protein C concentrate [human] intravenous infusion – Baxalta/Shire)

**REVIEW DATE:** 11/02/2022

---

### OVERVIEW

Ceprotin is indicated for pediatric and adult patients with **severe congenital protein C deficiency** for the prevention and treatment of venous thrombosis and purpura fulminans.<sup>1</sup>

### Disease Overview

Mutations in the *PROC* gene lead to deficiency of protein C, which is a natural anticoagulant.<sup>2</sup> Individuals with heterozygous *PROC* mutation present with milder disease but are at risk for development of venous thromboembolism. Those who have mutations in both *PROC* genes develop severe symptoms within a few hours to days after birth. In severe protein C deficiency, a complication called purpura fulminans may arise in which blood clots form throughout the body. Blood clots affect the extremities most often but can become widespread (disseminated intravascular coagulation), leading to tissue necrosis.

Diagnosis is based on characteristic symptoms and detailed family history, in addition to measurement of protein C activity or antigen levels.<sup>3,4</sup> It is critical to exclude any acquired reason for protein C deficiency, which is more common than congenital protein C deficiency.<sup>3</sup> Potential causes of acquired deficiency include vitamin K antagonists (e.g., warfarin), vitamin K deficiency, chronic liver disease, recent thrombosis, recent surgery, or disseminated intravascular coagulation. Diagnostic recommendations from the International Society of Thrombosis and Hemostasis recommend waiting until 30 days after vitamin K antagonist treatment ends to perform protein C assay testing.<sup>4</sup> Molecular genetic testing is only available in a few research laboratories and is not routinely used in clinical diagnosis.<sup>3</sup>

### Dosing Information

Dosing is highly individualized. Guidance specific to protein C deficiency is limited. The National Hemophilia Foundation Medical and Scientific Advisory Council (MASAC) provides recommendations regarding doses of clotting factor concentrate in the home (2016).<sup>5</sup> The number of required doses varies greatly and is dependent on the severity of the disorder and the prescribed regimen. Per MASAC guidance, patients on prophylaxis should also have a minimum of one major dose and two minor doses on hand for breakthrough episodes in addition to the prophylactic doses used monthly. The guidance also notes that an adequate supply of clotting factor concentrate is needed to accommodate weekends and holidays. Therefore, maximum doses in this policy allow for prophylactic dosing plus three days of acute episodes or perioperative management per 28 days. Doses exceeding this quantity will be reviewed on a case-by-case basis by a clinician.

Dosing considerations for individual indications are as follows:

- **Protein C Deficiency, Severe:** For routine prophylaxis, the maximum dose is 60 IU/kg once every 12 hours.<sup>1</sup> For acute episodes or perioperative prophylaxis, the prescribing information recommends a loading dose up to 120 IU/kg once, followed by 80 IU/kg every 6 hours for 3 doses, followed by 60 IU/kg every 6 hours thereafter.

### POLICY STATEMENT

Prior Authorization is recommended for medical benefit coverage of Ceprotin. Approval is recommended for those who meet the **Criteria** and **Dosing** for the listed indication. Requests for doses outside of the established dosing documented in this policy will be considered on a case-by-case basis by a clinician (i.e., Medical Director or Pharmacist). All approvals are provided for the duration noted below. Because of the specialized skills required for evaluation and diagnosis of patients treated with Ceprotin as well as the monitoring required for adverse events and long-term efficacy, approval requires Ceprotin to be prescribed by or in consultation with a physician who specializes in the condition being treated.

**Automation:** None.

## RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Ceprotin is recommended in those who meet the following criteria:

### FDA-Approved Indication

---

#### 1. **Protein C Deficiency, Severe.** Approve for 1 year if the patient meets the following criteria (A, B, C, and D)

- A) The diagnosis of protein C deficiency is confirmed by at least one of the following (i, ii, or iii):
  - i. Plasma protein C activity below the lower limit of normal based on the age-specific reference range for the reporting laboratory; OR
  - ii. Plasma protein C antigen below the lower limit of normal based on the age-specific reference range for the reporting laboratory; OR
  - iii. Genetic testing demonstrating biallelic mutations in the *PROC* gene; AND
- B) Acquired causes of protein C deficiency have been excluded; AND  
Note: Examples of acquired causes of protein C deficiency include recent use of vitamin K antagonists (e.g., warfarin) within 30 days, vitamin K deficiency, chronic liver disease, recent thrombosis, recent surgery, or disseminated intravascular coagulation.
- C) According to the prescriber, patient has a current or prior history of symptoms associated with severe protein C deficiency (e.g., purpura fulminans, thromboembolism); AND
- D) Ceprotin is being prescribed by or in consultation with a hematologist.

**Dosing.** Approve up to 4,440 IU/kg intravenously per 28 days.

---

## CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Ceprotin is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.
